

- RES support is an accepted market distortion to achieve RES objectives.
- Minimizing this distortive effect and making it as cost-efficient as possible, requires a market design based on following top 3 „must have“:

1.

Market design should always rely on competition as the most suitable framework for problem solving.

2.

The policy framework should be designed to serve society as a whole, rather than serving particular individual interests.

3.

A carbon tax on all energy sources could be a reasonable approach to refinance renewable support.
