# Key market design elements to support decarbonisation

## Generation

Long-term investment signals driven by price on carbon and flexible, market-oriented long-term support arrangements.

## Markets

High resolution short-term markets that support optimal operations (e.g. flexible RE) and investment in network infrastructure that efficiently manages congestion.

## Demand

Retail tariff reform that reveals the value of behind-the-meter gen and storage to consumers, incentivizes DR, and efficiently allocates system costs.

Thank you
